

COMFORTWASH

from the makers of Hanes™

Don't sacrifice softness and printability to give your customers the look they love.

Traditional Pigment Dyed Tees

Pigment dyes create **migration issues** that result in poor and discolored print quality.

Shoot-out leaves discolored spots on pigment dyed shirts, making ink errors a challenging issue to overcome for screen printers.

Traditional pigment dyed shirts can have an **uncomfortable and stiff** feeling that is unappealing to customers.

The dyeing process can create a broad spectrum of finished product **sizing and color variation**, causing fit and quality challenges for customers.

Using DTG pre-treat on pigment dye shirts can result in **staining**.

The ComfortWash Difference

Prints are durable and maintain quality and integrity of color and clarity.

Our proprietary dye process allows for better shoot-out performance, keeping the color of the garment intact and saving printers time and money.

ComfortWash tees and fleece are enzyme washed for ultimate softness right out of the box. Perfect for consumers and retail shelves.

ComfortWash garments are strictly monitored for size and color accuracy before leaving our manufacturing facilities. Our priority is consistency!

Because we don't use pigment dye, our shirts don't stain when pre-treating for DTG embellishment.
